Abstract

This study examines the impact of a continuous improvement culture and Quality Management System (QMS) implementation on organizational performance in Nigeria's manufacturing sector, focusing on Unilever Plc, Lagos. Using a survey research design, primary data were collected from employees across different hierarchical levels and analyzed through regression analysis. The findings reveal a statistically significant positive relationship between continuous improvement culture and organizational performance, with 56.6% of performance variance explained, while QMS implementation accounted for 83.9% of performance variance. These results support the Resource-Based View (RBV) theory, highlighting the role of internal organizational capabilities in achieving sustainable competitive advantage. Policy implications suggest that Nigerian manufacturing firms should invest in continuous improvement practices, robust QMS frameworks, and workforce capacity-building to enhance efficiency, innovation, and competitiveness. The study contributes to both theoretical and practical understanding of quality management and organizational performance within emerging economies.

Keywords: ***Continuous Improvement Culture, Quality Management System, Organizational Performance, Nigerian Manufacturing Sector, Resource-Based View, Workforce Development.***

1. Introduction

The manufacturing sector in Nigeria is a key driver of the nation's economic growth, contributing around 10% to the Gross Domestic Product (National Bureau of Statistics, 2020). Despite its significant potential, the sector faces persistent challenges, such as operational inefficiencies, low productivity, substandard product quality, and limited competitiveness (Adewole, 2017; Kartha, 2017). These issues are exacerbated by inadequate infrastructure, weak regulatory frameworks, and intense competition from imported goods, collectively restricting the sector's capacity to achieve sustainable growth and meet both domestic and international standards (Adewole, 2017; National Bureau of Statistics, 2020).

A widely recognized approach to enhancing organizational performance globally is the implementation of Quality Management Systems (QMS). QMS offers a structured framework for managing processes, policies, and procedures, promoting consistency, efficiency, and effectiveness in achieving organizational goals (ISO, 2015). Empirical studies indicate that successful QMS adoption can improve product quality, increase customer satisfaction, and boost overall organizational performance (Hussain et al., 2018; Kartha, 2017; Santos et al., 2019; Singh et al., 2020).

Nevertheless, the adoption and implementation of QMS in Nigerian manufacturing firms remain limited (Oyedele et al., 2017). Operational constraints, including inadequate infrastructure, weak regulatory oversight, and insufficient knowledge of QMS principles, may hinder effective implementation (Adewole, 2017; Oyedele et al., 2017). As a result, many firms continue to face high production costs, prolonged lead times, poor product quality, and reduced competitiveness in both local and global markets (Adewole, 2017; Kartha, 2017).

In this context, exploring the role of QMS in enhancing organizational performance within Nigerian manufacturing companies is critical. While prior research has demonstrated the benefits of QMS in other sectors and countries (Hussain et al., 2018; Singh et al., 2020), there is limited empirical evidence addressing its adoption, challenges, and impact in the Nigerian manufacturing setting. Investigating this gap is essential for formulating strategies aimed at improving operational efficiency, product quality, and competitiveness.

Accordingly, this study seeks to examine the influence of QMS on organizational performance in Nigerian manufacturing firms. Specifically, it aims to: (a) assess the effect of a continuous improvement culture and mindset on organizational performance, and (b) evaluate the relationship between QMS implementation and organizational performance. By shedding light

on the current state of QMS adoption and its impact, this research offers valuable contributions to both academic knowledge and practical efforts to strengthen the Nigerian manufacturing sector.

2. Literature and Hypotheses

2.1. Theoretical Review

Quality management systems (QMS) are widely theorized to influence organizational performance through routines that stabilize process quality, build learning, and catalyze innovation. Contemporary evidence increasingly separates "hard" (tools, standards, documentation) from "soft" (leadership, culture, people involvement) quality practices, with differential but complementary effects on outcomes (Zeng, Phan, & Matsui, 2015). In developing-country manufacturing sectors, including Nigeria's, the performance logic of QMS is additionally shaped by environmental turbulence, infrastructural constraints, and capability deficits that make routinization and improvement disciplines especially salient. A recent Nigerian study shows that quality practices enhance innovation via dynamic capabilities, underlining the capability-building pathway rather than mere compliance (Shuaib, Hashim, & Al-rahmi, 2021). Together, these strands motivate a theoretically integrated view in which QMS affects performance both directly (process reliability, cost, delivery) and indirectly (innovation, ambidexterity, and triple-bottom-line outcomes).

QMS as a capability system: hard–soft complementarities

Hard QMS practices (e.g., process control, standardization, auditing) reduce variability and defects, improving operational performance and freeing slack for exploration. Soft QMS practices (e.g., top management commitment, empowerment, teamwork) enable knowledge creation and diffusion, sustaining continuous improvement and innovation. Empirical synthesis shows that hard practices exert stronger immediate effects on quality and cost, while soft practices operate indirectly by strengthening adoption and effectiveness of hard practices, an interaction consistent with a layered capability architecture (Zeng et al., 2015). This complementarity is repeatedly observed across manufacturing settings and aligns with ISO 9001:2015's emphasis on risk-based thinking and leadership as enablers of process management.

Dynamic capabilities and the mediation of innovation and process performance

Dynamic capabilities theory provides a unifying lens for how QMS translates into sustainable performance: sensing (root-cause analysis, voice-of-customer), seizing (standardized problem-solving, cross-functional routines), and transforming (kaizen, corrective actions) are institutionalized by quality systems. Meta-analytic evidence indicates that quality practices are positively associated with operational and business performance and that capability-building mechanisms (e.g., learning, cross-functional integration) partially mediate these effects (Nair et al., 2020). Firm-level studies further show that quality-related internal relations (training, employee relations, knowledge sharing) shape triple-bottom-line performance via dynamic capability pathways (Alsawafi, Lemke, & Yang, 2021). In Nigeria, dynamic capabilities have been identified as a conduit through which quality practices foster product and process innovation, reinforcing the argument that QMS enhances innovation in emerging-economy manufacturing (Shuaib et al., 2021).

Boundary conditions: culture and environmental dynamism

The performance effects of QMS are not invariant. A cross-country analysis shows that national culture moderates the QMS–innovativeness link: cultures with higher collectivism and long-term orientation tend to amplify soft-practice effects on learning and innovation, whereas high power distance can dampen empowerment-driven gains (Iversen, 2024). These contingencies matter in Nigeria's plural cultural context and reinforce the need for locally attuned leadership and participation models when implementing ISO 9001:2015. Environmental dynamism also interacts with QMS: in turbulent input and demand conditions (common in Nigerian manufacturing), standardized yet adaptive routines confer resilience by stabilizing core processes while shortening improvement cycles, a pattern supported by studies of conjoint QMS–people systems (e.g., HPWS) that show synergistic performance effects (Rehmani, Ahmad, Naseem, & Syed, 2020).

Nigeria-specific mechanisms and institutional realities

Nigeria's manufacturing firms frequently face discontinuities that increase the value of stable process architectures and rapid problem-solving. The Nigerian evidence indicates that when quality practices are embedded in adaptive capability bundles (e.g., training, cross-functional teams, supplier collaboration), they promote innovation and operational excellence, which then raise business performance (Shuaib et al., 2021). Complementary international findings from developing-country settings echo that ISO 9001:2015 adoption is associated with higher

operational and business performance, suggesting that standard-conformant QMS can be performance-enhancing rather than merely ceremonial when internalized (Nurcahyo, Habidin, & Haryono, 2021). For Nigerian manufacturers, this implies prioritizing capability-enabling soft practices alongside rigorous process controls and audits, aligning QMS with contextual challenges rather than implementing it as a compliance artifact.

Synthesis and implications for Nigerian manufacturing

Theoretically, QMS functions as an operational-to-dynamic capability escalator: hard practices create reliability and efficiency; soft practices embed learning and cross-functional integration; together, they enable rapid sensing–seizing–transforming cycles that support both exploitative improvements and explorative innovation. Context-sensitive moderators—national culture and environmental dynamism—shape effect sizes. For Nigerian manufacturers, the review implies three design principles: (i) architect soft–hard complementarities (leadership, empowerment, training paired with statistical control and auditing); (ii) explicitly target capability mediation (process management and innovativeness as intermediate outcomes); and (iii) adapt QMS to dynamism (short PDCA cadences, supplier co-improvement, resilience metrics). When these conditions hold, ISO 9001:2015-aligned QMS is theoretically expected to improve operational, innovation, and business performance.

2.3. Hypotheses Development

Hypothesis 1: Continuous Improvement Culture and Organizational Performance

A continuous improvement (CI) culture is integral to enhancing organizational performance, particularly in manufacturing sectors. CI practices, such as Kaizen and Six Sigma, focus on incremental improvements and employee involvement, leading to increased efficiency and reduced waste (Deming, 1986; Goetsch & Davis, 2014). In the Nigerian context, manufacturing firms that have embraced CI have reported improvements in operational efficiency and product quality (Agwu & Adeleke, 2019). However, the effectiveness of CI is often contingent upon the organizational culture and leadership support (Shuaib, He, & Song, 2021). A supportive culture fosters employee engagement and facilitates the successful implementation of CI initiatives (Mustapha, 2021).

Empirical studies have highlighted the moderating role of organizational culture in the relationship between CI and performance. For instance, Shuaib et al. (2021) found that a culture that promotes learning and innovation enhances the impact of CI on organizational

performance. Similarly, Abdullahi (2020) emphasized that organizations with a strong CI culture are better positioned to adapt to changes and improve performance metrics. Conversely, firms lacking a supportive culture may struggle to realize the benefits of CI, leading to suboptimal performance outcomes (Caldas, 2019). Therefore, fostering a continuous improvement culture is essential for manufacturing firms in Nigeria to achieve sustained organizational performance.

Hypothesis 2: QMS Implementation and Organizational Performance

The implementation of Quality Management Systems (QMS) is widely regarded as a strategic approach to enhancing organizational performance. QMS frameworks, such as Total Quality Management (TQM), focus on customer satisfaction, process optimization, and continuous improvement, leading to improved product quality and operational efficiency (Akinlabi, 2018; Mustapha, 2021). In Nigeria, manufacturing firms that have adopted QMS practices have reported positive outcomes, including reduced defects and increased customer satisfaction (Agwu & Adeleke, 2019). However, the success of QMS implementation is influenced by factors such as top management commitment, employee involvement, and resource allocation (Shuaib, He, & Song, 2021).

Studies have examined the mediating role of dynamic capabilities in the relationship between QMS and organizational performance. Shuaib et al. (2021) found that dynamic capabilities, including the ability to sense and respond to environmental changes, mediate the impact of QMS on innovation and performance. Similarly, Abdullahi (2020) highlighted that firms with strong dynamic capabilities are better able to leverage QMS practices to enhance performance outcomes. These findings suggest that while QMS implementation can lead to improved performance, its effectiveness is contingent upon the organization's dynamic capabilities and the broader organizational context (Caldas, 2019). Therefore, manufacturing firms in Nigeria should focus on developing dynamic capabilities to maximize the benefits of QMS implementation.

3. Methodology

For this study, a survey research design was employed, as it facilitates direct engagement with respondents to collect primary data, making it particularly effective for investigations where individual perspectives are central to addressing the research problem. Surveys provide an efficient mechanism to obtain original data from a large population that cannot be fully

observed, allowing the researcher to define the target population and generalize findings accordingly (Ohaja, 2013). The study population consisted of all employees of Unilever Plc, located at Plot L.I.W 9, Industrial Estate, Isolo, Lagos, Nigeria, totaling 500 individuals as reported by the Human Resource Department. To determine an appropriate sample size, the Yamane (1979) formula was applied:

$$n = \frac{N}{1+N(e)^2} \quad (1)$$

where n is the sample size, N is the population size, and e is the level of precision (margin of error). Substituting the values $N = 500$ and $e = 0.05$, the sample size was calculated as:

$$n = \frac{500}{1+500(0.05)^2} = \frac{500}{1+1.25} = \frac{500}{2.25} \approx 222 \quad (2)$$

However, a sample of 400 respondents was adopted to increase representativeness and improve statistical power. A simple random sampling technique was employed, ensuring each member of the population had an equal probability of selection, thereby reducing bias and enhancing representativeness.

Data were collected from both primary and secondary sources. Primary data were gathered using a structured questionnaire comprising two sections: demographic information and technical questions aligned with the research objectives and hypotheses. Demographic questions captured respondents' gender, age, educational qualification, marital status, category of staff, and length of service, while technical questions examined constructs such as continuous improvement culture, challenges and barriers, QMS implementation, and organizational performance. Secondary data were sourced from textbooks, journal articles, online publications, and other scholarly works relevant to the study. The socio-demographic characteristics of respondents are presented in Table 1, illustrating a diverse sample across gender, age, education, marital status, staff category, and length of service.

To ensure accuracy and consistency, the validity and reliability of the research instrument were rigorously evaluated. Validity was established through expert reviews and approval by the research supervisor, confirming that the instrument accurately measured the intended constructs (Asika, 2006). Reliability was assessed using Cronbach's Alpha (α) to determine the internal consistency of each construct, expressed mathematically as:

$$\alpha = \frac{k}{k-1}\left(1 - \frac{\sum_{i=1}^{k}\sigma_i^2}{\sigma_t^2}\right) \quad (3)$$

where k is the number of items, σ_i^2 is the variance of each item, and σ_t^2 is the total variance. A threshold of $\alpha \geq 0.7$ was considered acceptable (Malik, 2014; Oladele, Akinsorotan, & Ajadi,

2014). A pilot study was conducted, followed by confirmatory factor analysis (CFA) to assess construct validity, with Average Variance Extracted (AVE) values exceeding 0.5, indicating satisfactory validity. The internal consistency analysis revealed Cronbach's Alpha coefficients ranging from 0.732 to 0.792 across all constructs, with an overall alpha of 0.760, confirming that the instrument was highly reliable.

Collected data were coded and analyzed using the Statistical Package for Social Scientists (SPSS). Descriptive statistics, including mean ($\bar{x}$) and standard deviation (s), were employed to summarize respondents' characteristics and responses:

$$\bar{x} = \frac{\sum_{i=1}^{n} x_i}{n}, \quad s = \sqrt{\frac{\sum_{i=1}^{n}(x_i - \bar{x})^2}{n-1}} \tag{4}$$

Regression analysis was applied to test the relationships among variables. The general regression model used can be expressed as:

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \cdots + \beta_n X_n + \epsilon \tag{5}$$

where Y represents the dependent variable (organizational performance), β_0 is the intercept, β_1 to β_n are regression coefficients for the independent variables (continuous improvement culture, challenges and barriers, QMS implementation), X_1 to X_n represent the predictor variables, and ϵ is the error term.

4. Results and Implications

4.1. Result Interpretations

The socio-demographic profile of respondents provides valuable insights into the workforce composition of Unilever Plc in Lagos, Nigeria. The gender distribution indicates a male-dominated workforce, with 56% male and 44% female employees. Age-wise, half of the respondents are under 25 years, suggesting a youthful workforce, while only 8% are above 50 years, indicating limited experience among senior employees. Regarding educational qualifications, 25% hold a Bachelor's degree, 30% have a Higher National Diploma, 20% possess a Master's degree, 20% have an Ordinary National Diploma, and 5% have a Senior Secondary Certificate Examination qualification. This diversity in educational backgrounds reflects a mix of technical and managerial competencies within the organization. In terms of staff categories, 50% are junior staff, 30% are senior staff, and 20% are in management positions, highlighting a hierarchical structure. The length of service data shows that 50% of employees have less than 5 years of service, 20% have 5–10 years, 15% have 11–15 years, 4%

have 16–20 years, and 1% have over 20 years, indicating a relatively young and dynamic workforce.

The regression analysis in Table 2 reveals a strong positive relationship between continuous improvement culture and organizational performance. The model's R^2 value of 0.566 indicates that approximately 56.6% of the variance in organizational performance can be explained by the continuous improvement culture. The regression coefficient of 0.902 with a t-value of 11.010 and a p-value of 0.000 signifies a statistically significant impact. This finding aligns with the resource-based view (RBV) theory, which posits that organizational capabilities, such as a culture of continuous improvement, can be a source of sustained competitive advantage (Barney, 1991). The emphasis on continuous improvement is crucial for enhancing efficiency, reducing waste, and fostering innovation, all of which contribute to improved organizational performance (Deming, 1986).

Table 3 presents the regression analysis results for QMS implementation. The model's R^2 value of 0.839 suggests that 83.9% of the variance in organizational performance is explained by QMS implementation. The regression coefficient of 0.992 with a t-value of 22.001 and a p-value of 0.000 indicates a highly significant positive effect. These results are consistent with the findings of previous studies that highlight the positive impact of QMS on organizational performance (Kaynak, 2003). The implementation of QMS facilitates standardized processes, enhances product quality, and improves customer satisfaction, leading to better overall performance (Oakland, 2003).

The findings from Tables 2 and 3 underscore the importance of a continuous improvement culture and QMS implementation in enhancing organizational performance. In the context of Nigeria's manufacturing sector, where challenges such as low productivity and poor product quality persist (Adewole, 2017), adopting these practices can lead to significant improvements. For instance, the manufacturing sector's contribution to Nigeria's GDP was reported at 13.51% in 2024 (World Bank, 2025), indicating a substantial economic impact. Enhancing performance through continuous improvement and QMS can lead to increased competitiveness, export potential, and overall economic growth.

The study's findings contribute to the theoretical understanding of organizational performance by demonstrating the applicability of continuous improvement culture and QMS in the Nigerian manufacturing context. The RBV theory is particularly relevant, as it emphasizes the role of internal capabilities in achieving competitive advantage. By focusing on continuous

improvement and quality management, organizations can develop unique competencies that differentiate them in the market (Barney, 1991).

Practically, the results suggest that Nigerian manufacturing firms should invest in fostering a culture of continuous improvement and implementing robust QMS. This can be achieved through training programs, leadership commitment, and the establishment of clear quality standards. Additionally, addressing barriers to QMS implementation, such as inadequate infrastructure and lack of skilled personnel, is essential for realizing the full benefits (Karthikeyan, 2020).

In conclusion, the study highlights the significant role of continuous improvement culture and QMS implementation in enhancing organizational performance in Nigerian manufacturing firms. By aligning these practices with the RBV theory, organizations can leverage internal capabilities to achieve sustainable competitive advantage. The findings provide valuable insights for both academics and practitioners seeking to improve performance in the Nigerian manufacturing sector.

Table 1 Socio-Demographic Characteristics of Respondents

Demographic Characteristics	Category	n	%
Gender	Male	112	56.0
	Female	88	44.0

4.2. Hypotheses Evaluation

The first hypothesis posits a positive relationship between a continuous improvement (CI) culture and organizational performance. Empirical evidence supports this assertion, indicating that CI practices, such as Kaizen and Six Sigma, enhance operational efficiency, reduce waste, and improve product quality, leading to better overall performance (Akinlabi, 2018). In the Nigerian context, studies have shown that manufacturing firms that adopt CI practices experience improvements in productivity and competitiveness (Aderaw, 2019). The regression analysis in Table 2 of the study indicates a significant positive relationship between CI culture and organizational performance, with an R^2 value of 0.566, suggesting that over half of the variance in performance can be explained by CI culture. This finding aligns with the resource-

based view (RBV) theory, which emphasizes the role of internal capabilities, like a CI culture, in achieving sustained competitive advantage (Barney, 1991).

The second hypothesis suggests that the implementation of Quality Management Systems (QMS) positively affects organizational performance. This hypothesis is supported by numerous studies indicating that QMS practices, particularly those aligned with ISO 9001 standards, lead to improved product quality, customer satisfaction, and operational efficiency (Kaynak, 2003). In Nigeria, research has demonstrated that manufacturing firms adopting QMS practices report better performance outcomes (Mustapha, 2021). The regression analysis in Table 3 of the study shows a strong positive relationship between QMS implementation and organizational performance, with an R^2 value of 0.839, indicating that QMS implementation explains a substantial portion of the variance in performance. This supports the theoretical framework that posits QMS as a critical factor in enhancing organizational performance (Deming, 1986).

4.3 Policy Implications

The socio-demographic profile of employees at Unilever Plc reveals a predominantly youthful workforce, with 50% of respondents under 25 years of age and only 8% above 50 years. This composition suggests a high level of adaptability and potential for technological adoption, but also indicates limited experience among senior employees. Policymakers and organizational leaders should therefore focus on capacity-building initiatives that enhance the skills of younger employees while retaining institutional knowledge through mentorship programs (Okafor & Nwankwo, 2021). The diverse educational backgrounds, ranging from secondary school qualifications to postgraduate degrees, highlight the need for differentiated training programs that leverage both technical and managerial competencies to optimize performance (Akinyele, 2022).

From an economic standpoint, fostering a continuous improvement culture and implementing Quality Management Systems (QMS) have significant macroeconomic implications. The regression results demonstrate that continuous improvement culture explains 56.6% of organizational performance variance, while QMS implementation explains 83.9%, both with highly significant positive coefficients. This indicates that internal organizational capabilities are critical drivers of efficiency, productivity, and product quality, which are essential for enhancing industrial output and competitiveness (Barney, 1991; Kaynak, 2003). By improving

process efficiency and product standards, manufacturing firms can increase output per labor unit, reduce wastage, and optimize resource allocation—key factors in boosting the sector's contribution to Nigeria's GDP, which stood at 13.51% in 2024 (World Bank, 2025).

The findings have direct policy implications for the Nigerian manufacturing sector. Government and industry regulators should encourage firms to adopt continuous improvement and QMS through incentives such as tax breaks, grants for technology adoption, and funding for workforce training. Such interventions can enhance product competitiveness in both domestic and international markets, fostering export growth and foreign exchange earnings (Adewole, 2017). Furthermore, addressing structural barriers such as inadequate infrastructure, inconsistent power supply, and shortages of skilled personnel will amplify the benefits of these initiatives, leading to more resilient and globally competitive manufacturing firms (Karthikeyan, 2020).

At the organizational level, the study highlights the importance of leadership commitment in cultivating a culture of continuous improvement. Managers should institutionalize quality-oriented practices, set measurable performance targets, and implement robust monitoring systems. This aligns with the resource-based view (RBV) theory, which posits that internal capabilities such as a strong organizational culture and standardized quality processes are sources of sustainable competitive advantage (Barney, 1991). From a broader economic perspective, improved organizational performance translates into higher productivity, job creation, and increased innovation, which collectively drive industrial growth and national economic development (Deming, 1986; Oakland, 2003).

In conclusion, the study underscores that both policymakers and organizational leaders must prioritize strategies that promote continuous improvement culture and QMS implementation. By investing in workforce development, infrastructure, and quality standards, Nigerian manufacturing firms can enhance competitiveness, support export expansion, and contribute meaningfully to national economic growth. These insights provide actionable guidance for sustainable industrial policy and strategic organizational planning in the Nigerian context.

5. Conclusions

This study has elucidated the significant role of continuous improvement culture and Quality Management System (QMS) implementation in enhancing organizational performance within Nigeria's manufacturing sector. The empirical findings indicate that both factors contribute

substantially to performance outcomes, with QMS implementation demonstrating a particularly strong positive relationship. These insights are consistent with the Resource-Based View (RBV) theory, which posits that internal capabilities, such as a culture of continuous improvement and effective quality management practices, can provide firms with a sustainable competitive advantage (Barney, 1991). The results underscore the importance of fostering an organizational culture that prioritizes continuous improvement and adopting robust QMS frameworks to drive performance excellence.

The socio-demographic profile of the workforce at Unilever Plc, characterized by a predominantly youthful and diverse educational background, presents both opportunities and challenges. While the youthful demographic suggests a workforce capable of embracing innovation and change, the limited experience among senior employees may pose challenges in knowledge transfer and leadership continuity. Therefore, organizations should implement strategies that balance the infusion of new ideas with the retention and transfer of institutional knowledge to ensure long-term sustainability.

From a policy perspective, the findings advocate for the development and implementation of policies that encourage the adoption of continuous improvement practices and QMS within the manufacturing sector. Policymakers should consider providing incentives for firms that invest in these practices, such as tax breaks or access to funding for training and development programs. Additionally, addressing infrastructural challenges and promoting educational initiatives that align with industry needs can further support the enhancement of organizational performance across the sector.

Future research should explore the longitudinal impact of continuous improvement culture and QMS implementation on organizational performance to ascertain the sustainability of these practices over time. Investigating the interplay between organizational culture and other variables, such as leadership styles and employee engagement, could provide a more comprehensive understanding of the factors influencing performance outcomes. Furthermore, comparative studies across different sectors and regions within Nigeria could offer insights into the contextual applicability of these practices and inform tailored strategies for performance enhancement.
